

What do I want to learn or understand better?

I want to improve my skills as a developer as well as put in practice some of the knowledge I have acquired during previous courses. More specific I am expecting to get use for what I have learnt about databases, design and user experience as well as JAVA programming and to be able to combine all of this into a complete application that will bring value for our extern partner. I want to also challenge my self using a new tool for development and with this expand my skills. Another aspect I would like to understand better and get better at, is the dynamics of working and developing a product in a group as it will be fundamental later on in my work life. This I am expecting to achieve trough this course with the help of the scrum methodology and agile methods.

At the end of this project I expect to have achieved the previous mentioned goals and for it the plan is to actively collaborate in my group and help structuring the work according tho scrum methodology and agile principles.

How can I help someone else, or the entire team, to learn something new?

I aspire to help the entire team by creating a continuous collaboration with our extern partners. Right now we have just discuss the basic idea and how we could collaborate but during this week the main goal is to get a better understanding of our partners needs and how our app could create value for them, as well as getting more information on how they would want the app to end upp being, in terms of (design and functionality). After this I can present a more clear idea to the grupp and start working on it. For reaching the weeks goal I will have a first meeting with our partner as well as exploring the possibility to find more people that could give us valuable feedback on the project and would want to get involved.

When it comes to help others to learn something new I can try to collaborate with my knowledge of previous courses, taking into consideration that the group members come from different backgrounds I imagine some of us have more experience in programming.

What is my contribution towards the team's use of Scrum?

I am involved in a student association and for what I have read about Scrum it's kind of similar to the way we distribute and organise the work at this association. With this in mind I think i can contribute to the teams use of scrum based on this experience.

What is my contribution towards the team's deliveries?

This week I have contributed by sharing an idea I had since before, I also had connections to an extern partner I found to be perfect for helping us and giving us feedback. I shared the idea with the group and they found it interesting, we also discuss how we could implement this and decided we would use it for the project. I have also contributed but given feedback and discussing other ideas we considered.
