What do I want to learn or understand better?

I want to learn better design practices when working with android and designing a User Interface. This sprint I have realised that the way our quiz was designed and coded maybe wasn't the best, we have encounter multiple problems and bugs that have slowed our work flow, this I think could had been avoided. For this I am gonna read more about best practices in android and we may refactor part of our code, depending on how much time we have.

How can I help someone else, or the entire team, to learn something new?

This sprint I have started to collaborate more with different members of our team, in the previous sprints I had been mainly collaborating with Pegah, who I had worked together with since previous courses. For future sprints I will propose to the group to keep mixing which members work together since I think is a good way of learning from people with different backgrounds and experiences, and while discussing about possible solutions, or trying to figure out what is wrong together I think we can all learn from each other and maybe see the problem from a different perspective.

What is my contribution towards the team's use of Scrum?

I keep working with my role as Product Owner, getting feedback from our stake holder and working as a link between the development team and the stake holder. This week I had my weekly meeting with our stake holder and I also had a meeting with a second doctor that give us feedback regularly. After this two meeting I tried to summarised the expectations towards the app, with this I made a clear priority list that the group could follow for the rest of the project scope. Some changes were made to the functionality we were planing to have after realising they weren't really of that much value to our external partner, some functionality and user stories to be implemented were instead aded after realising this had more value for our final users. So in general I made quite a few changes and improvements to our user stories to give the group a more clear view of what we have done so far and what we have yet to implement before the end of the project scope.

What is my contribution towards the team's deliveries?

I have contributed by taking my role as product owner, and making an updated priority list that will help the development team decide what we should focus on for the sprints we have left.

I have also contributed by connecting our user interface to our system to save the data, while doing this I have encounter multiple difficulties and unexpected bugs which has slowdown my work.
